

LC Tracer Light Patch Cord

Description

Tracking fiber optic jumpers are designed for (FTTH) intra-enterprise networks, and other fiber optic identification needs. Both ends of the tracking fiber optic jumper are assembled by conventional connectors (LC/SC/FC/ST), which contains a connector, a cover, a light-emitting device, a conductor, etc.

The LED light source is built into the tracking fiber jumper. Press the switch at either end and the LED light will appear quickly at both ends of the jumper. Since the other end of the remote jumper will also glow, the location of the other end can be easily and quickly determined without interruption of service. It has the advantages of quick identification of port, eliminating misinsertion, improving wiring efficiency, small size, interchangeable all-in-one dual-core connection.
